Allocation
of Claim
Costs
Table 3

Horizontal

Allocation

This table calculates the claim cost per day and then allocates the claim cost per day across the policy periods. The claim cost per day is calculated by figuring out the number of days of exposure and dividing that number into the total claim cost. This number is then allocated across the policy based on the number of days the policy was on the risk.

If the event that the date of first involvement occurred prior to or during a policy period, the number has been adjusted to accurately reflect the number of days the policy was on the risk for the particular claim.

Note that the exposure period used for this allocation is: Allocation across claim years
